a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase. The PMAs are useful as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to
                                                                  detect and/or quantitate polymicleotide having the human telomerase RNA component (HTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal suspects or unknown descendants based on the hTR gene RFLP pattern. The PNA can be further used for treating or preventing cancer, inflammation, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases. The PNAs in combination with other pharmaceuticals (such as antinoeplastic or cytostatic agents) can be used for treating neoplasta human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomere metabolism or telomerase activity. The present sequence represents a phosphorothicate (PS) oligomer used to inhibit telomerase activity in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotide useful for inhibiting telomerase activity in cells, c for treating telomerase-mediated condition or disease, such as cancers, tumors, Hodgkin's disease, or inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; telomerase; hTR; cytostatic; anti-inflammatory; adenocarcinoma;

The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a class and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, proctate or colon, mixed cell leukaemia, Hodgkin's disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the treatment of tumour. The polynucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibitors and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative captesion of telomerase, and in treating veterinary proliferative captession of telomerase in hammatopoietic stem cells is useful for immunosuppression and for selectively down-regulating specific for immunosuppression and for selectively down-regulating specific contended of the immune system. The present sequence represents human telomerase polynucleotide inhibitor #8, as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                        The invention relates to polymucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia, CK Hodgkin's disease, fertility and inflammatory conditions. (I) are also useful in treating a tumour or in manufacturing a medicament for the ctreatment of tumour. The polymucleotide inhibitors may also be used in catament of tumour. The polymucleotide inhibitors may also be used in catament of tumour or in useful in prophylactic and therapeutic activity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative configences in thibition of telomerase in haematopoletic stem cells is useful for immunosuppression and for selectively down-regulating specific branches of the immune system. The present sequence represents human the immonerace polynucleotide inhibitor #12, as described in the method of
                                                                                                                                                                                                                                                                                                                                                                                        .;

New polynucleotide useful for inhibiting telomerase activity in cells, or for treating telomerase-mediated condition or disease, such as cancers, tumors, Hodgkin's disease, or inflammatory conditions.

```
The invention relates to polymucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and proliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia. (Consection of disease, fertility and inflammatory conditions. (I) are also treatment of tumour or in manufacturing a medicament for the treatment of tumour. The polymucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibition of telomerase cation cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative capression of telomerase, and in treating veterinary proliferative for immunosuppression and for selectively down-regulating specific branches of the immune system. The present sequence represents human the inversion that in the present sequence represents human the inversion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            note= "2',4'-oxyethylene linkage in the sugar residues"

                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                       ö
                                                                                                              The present invention relates to novel 2',5'-oligoadenylic acid analogs and their pharmacologically- acceptable sakies. The analogs are stable with superior antitumour and antiviral activity and so are useful in cancer or antiviral therapy e.g. as antisense drugs. The present sequence

                                                                   The present invention relates to novel 2',5'-oligoadenylic acid analogs and their pharmacologically- acceptable salts. The analogs are stable with superior antitumour and antiviral activity and so are useful in cancer or antiviral therapy e.g. as antisense drugs. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2 Primers (see AAV27886 and AAV27887) are used in the PCR amplification of a 520 bp fragment of telomerase genomic DNA from HeLa cells. The PCR product was used to prepare 2 DNA constructs, each containing the T7 product. was used to prepare 2 DNA constructs, each containing the T7 promoter. One construct (for primers see AAV27888-89) contained DNA which would generate sense strand human telomerase RNA in a transcription reaction. The other construct (for primers see AAV27889-91) contained DNA which would generate antisense strand human telomerase RNA in a transcription reaction. The human telomerase RNA was used for in vitro assays to demonstrate that wild-type TP2 and sense telomerase RNA are required for telomerase activity, Novel TP2 can be used to develop products that regulate telomerase activity, useful e.g. for treating cancer, AIDS and ageing disorders.                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an antisense compound targeted to a nucleic acid molecule encoding acyl-coenzyme A synthetase 1 (ACS1). The antisense compound specifically hybridises with and inhibits the expression of ACS1. The antisense oligonucleotides or compounds are useful for inhibiting the expression of acyl-coenzyme A synthetase 1 (ACS1), and for treating diseases or conditions associated with aberrant expression of ACS1, e.g. diabetes, obesity, metabolic syndrome X, cardiovascular reagents and kite, or in diagnostic, therapeutic and prophylactic applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents an acyl-coenzyme A synthetase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense compounds targeted to nucleic acid molecules encoding acyl-coenzyme A synthetase 1 (ACS1), useful for treating diseases or conditions associated with aberrant expression of ACS1, e.g. diabetes,

The invention relates to an antisense compound targeted to a nucleic acid molecule encoding acyl-coenzyme A synthetase 1 (ACS1). The antisense compound specifically hybridises with and inhibits the expression of ACS1. The antisense oligonucleotides or compounds are useful for inhibiting the expression of acyl-coenzyme A synthetase 1 (ACS1), and for treating diseases or conditions associated with aberrant expression of ACS1, e.g. diabetes, obesity, metabolic syndrome X, cardiovascular disorder or cancer. The antisense compounds are also useful as research reagents and kits, or in diagnostic, therapeutic and prophylactic applications, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence represents an acyl-coenzyme A synthetase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compounds targeted to nucleic acid molecules encoding acylcoenzyme A synthetase 1 (ACS1), useful for treating diseases or conditions associated with aberrant expression of ACS1, e.g. diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cold-adapted influenza virus; passage culture; PB2 protein; PB1 protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     à
                                                                                                                                                                                                                                                                                  The invention relates to cold-adapted influenza viruses prepared by passage culture of A/X-31, B/Yamagata/16/88 or B/Lee/40 viruses at low temperatures A cDNA gene of cold-adapted influenza virus HTCA-A101 can be selected from a group consisting of PB2 protein gene, PB1 protein gene, RAPRS129.2 x813197). The method is useful for the production of coldadapted influenza virus that exhibit temperature sensitivity and can be actively grown in fertilized eggs. The virus is useful for vaccines for protection against flu. Live vaccines containing cold-adapted viruses have several advantages over killed vaccines. It can prevent reduction of immunogenicity, which may occur in the killed vaccine where antigenic protecins would be denatured at its inactivation. It can also avoid proteins it promotes the immunity by inducing IgA and it can be administered into a spray formulation via nasal cavity and thus its administered into a spray formulation via nasal cavity and thus its convenient for children. It she expected.

This invention describes a novel rapid and sensitive method for detecting Histoplasma capsulatum. The method uses oligonucleotide primers which amplify a segment of DNA specific to the H. capsulatum 5.85 rRNA gene. The method of the invention can be used to detect H. capsulatum in a wide variety of samples. For example, for public health protection convironmental samples containing soil, vegetation, dust, decaying faeces for midial packs etc. can be assayed for the presence of the canalysed e.g. those who are suspected of having contracted fresh histoplasmosis as a result of symptomology, and immune compromised individuals who may be at risk of contracting orhonic pulmonary or ocular chaptasmosis. The prior arisk of contracting orhonic pulmonary or ocular chaptasmosis. The prior arisk of contracting orhonic pulmonary or capsulatum is expensive and requires several weeks to complete. The capsulatum is expensive and requires several weeks to complete. The sample are collected, small but highly contaminated areas can be overlooked. A need exists for a specific, sensitive, and rapid assay for H. capsulatum. The present invention provides this need, as it is rapid, sensitive and inexpensive. This sequence represents PCR primer HCI which is used in the method of detection. (Updated on 15-SEP-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                          ö
                                                                                                        The polymucleotide contains the partial base sequence of the Japanese type C hepatitis virus (HCV) gene. The DNA was obtd. from the serum of a non A non B hepatitis patient. The serum was ultracentrifuged and the ppte. dissolved in a mixture of GITC, Na citrate, sarcosine and mercaptoethanol. Phenol chloroform was added and the mixture centrifuged. Isopropanol was added to the aq. layer which was left to stand at -20 deg C for 3 hrs, then centrifuged. The ppte. was treated by GITC and phenolchloroform and pptd. by ethanol and dissolved in di20 to give an aq. DNA soln. The gene was amplified by PCR and the HCV gene cloned for determination of its base sequence. A genomic version of the sequence was given (AAQ23036). In the version shown there is a Y at base 189. The DNA in the specification has a guanine at this position. The DNA may be used as a probe for detection of Japanese type C hepatitis. See also AAQ23264
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for inducing apoptosis in a cell or animal comprising administering to a cell or animal a Jagged 2

Antisense compounds of the invention are useful for treating an animal having a disease or condition associated with Jagged 2 e.g. hyperproliferative disorder (particularly cancer), a developmental disorder or a disease or condition that arises from aberrant apoptosis. They are also used for diagnostics, prophylaxis or as research reagents or kits. The invention is also useful in antisense therapy. The present sequence is human Jagged 2 blw appendic PCR primer. This sequence is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense, Jagged 2; hyperproliferative disorder; cancer; developmental disorder; apoptosis; prophylaxis; antisense therapy; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating Jagged 2 expression, useful for diagnosing, preventing or treating diseases or conditions associated with Jagged 2, e.g. cancer or developmental disorders.
                    treating a subject having a disease or condition associated with insufficient apoptosis by administration of a Jagged 2 inhibitor; (2) a pharmaceutical composition comprising a Jagged 2 inhibitor and another active ingredient for inducing apoptosis; and (3) a kit comprising a Jagged 2 inhibitor and instructions for using the Jagged 2 inhibitor in the induction of apoptosis. The Jagged 2 inhibitor has cytostatic activity. The method can be used for inducing apoptosis in a cell or animal for treating a subject having a disease or condition associated with insufficient apoptosis, e.g., hyperproliferative disorder. The present sequence represents a PCR primer for human Jagged 2, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
to reduce Jagged 2 levels or activity. Also described:

This invention relates to novel antisense compounds that can be used to modulate the expression of Jagged 2. Specifically, it refers to compositions useful for inhibiting the expression of Jagged 2, a human homologue of the Drosophila Scrate gene, which is involved in differentiation and cell fate, as well as positive feedback control over signalling genes such as Notch 1, Notch 3 and Jagged 1. The Jagged 2 gene is located on chromosome 14932, a region that has been implicated in genetic diseases including Usher syndrome type la that is associated with cetinitis pigmentosa. The present invention describes antisense oligonucleotides that comprise at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MOE) and at least one modified nucleobase, a 5-cmethoxyethyl (2' MOE) and at least one modified nucleobase, a 5-cmethoxyethyl (2' MOE) and at least one modified nucleobase, a 5-cmethylcytosine. These compounds are useful for modulating the mucleic acid molecules encoding Jagged 2, ultimately modulating the amount of Jagged 2 produced, which in turn is useful for research

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg<sup>2</sup>+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of cother drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammatory bowel disease or injury application, inflammatory bowel disease or included the contral nervous systems of the contral nervous systems.
                                                                                                                                                                                           G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; human; lung cancer; prostate cancer; colorectal cancer; brain cancer; coesphageal cancer; scancer; colorectal cancer; pancreatic cancer; cervical cancer; head and neck cancer; ovarian cancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitaxel; docetaxel; cisplatin; methotrexate; gencitabine; radiation therapy; inflammatory disease; asthma; diabetes; theumatoid arthritis; restenosis; Crohn's disease; obesity; ischaemis; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammatory bowel disease; infection; se.
                                                                                                                                                                         Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG<sup>2</sup>2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, methotrexate, committabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as the molecules are also useful for treating inflammatory disease such as checkin, general methods, restenosis, statema, Crohn's disease, diabetes, obesity, autoimmune disease, lugus, multiple sclarosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury sepsis, allergic airway inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ss; enzymatic nucleic acid; RNA cleavage; hepatitis C virus; HCV;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is an antisense oligonucleotide which was used in an RNase mapping experiment. This enables the identification of sites within the Ii RNA strand which hybridise to antisense DNA. These sites can then be used as targets for antisense strands which may, using gene therapy, be used as tumour cell vaccines (for example to treat carcinomas, namelanoma, laukaemia, lymphomas, stomach, breast, colon or rectum, lung, prostate, bladder, pancreas, brain and ovarian cancers), or they can be used to treat autoimmune diseases including rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunoregulator; antisense oligonucleotide; cancer; tumour cell vaccine; rheumatoid arthritis; autoimmune disease; diabetes mellitus; thyroiditis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense oligonucleotide for use in RNase H mapping assay SEQ ID NO: 24.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cancer cell vaccine for treating malignancies, autoimmune disorders and isolating autodeterminant peptides comprises a regulator of invariant chain protein expression or immunoregulatory function.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            expressing antibody fusion proteins. The invention also relates to novel fusion proteins comprising an immunoglobulin (19) molety fused to a non-immunoglobulin molety fused to a non-immunoglobulin molety where the immunoglobulin molety comprises a first domain from a first antibody sotype and a second domain from a second antibody isotype. The antibodies or 1g fusion proteins are useful to produce intext antibodies, immunocytokines, immunoflusions, immunoligands and other antibody and Fc fusion proteins that enhance the expression, proper oligomerisation, purification and protease resistance of desired fusion proteins, optionally with modified, combined or decreased Fc effector functions. The present sequence is a PCR primer which is used to construct human KSgamma2h antibody expression vector. This sequence is used in the exemplification of the invention
                                                                                   Immunoglobulin; Ig; antibody; immunocytokine; immunofusion; immunoligand;
protease resistance; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       we fusion protein, useful for producing antibodies, immunocytokines or tusion proteins that enhance the expression or protesse resistance of fusion protein, comprises an immunoglobulin (Ig) moiety fused to a non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cdc25; Cdc25 phosphatase; transcription; modulator; murine; CDc25A; exon;

The present invention relates to detecting and identifying fungal pathogenic species in a sample. The method involves hybridizing a nucleic acid of a fungal pathogen possibly present in the sample with at least one oligonucleotide probe, from an Internal Transcribed Spacer (ITS) region. The method is useful for simultaneous detection and differentiation of clinically important fungi in a single assay, particularly Candida albicans, C. parapsilosis, C. tropicalis, C. kefyr, C. krused, C. glabrata, C. dubliniensis, Aspergillus flavus, A. versicole, A. nidulans, A. fumigatus, C. neoformans and pneumocystis carini. The method is especially useful in the detection of opportunistic infections in patients with impaired immunity systems, such as organ transplants patients, patients receiving intensive anticancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The patent discloses new macromolecules of formula PNA-DNA-PNA, in which DNA comprises at least one 2'-deoxynucleotide and each PNA comprises at least one peptide nucleic acid subunit. These compounds have increased resistance to nuclease and increased specific binding affinity, and they can activate RNaseH for target strand cleavage. They can hybridise specifically to a nucleic acid strand (especially RNA) and are useful (1) for treating diseases associated with undesirable production of protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New chimeric macromolecules contg. DNA and peptide nucleic acid segments - with good nuclease stability and binding affinity, also activating RNaseH, useful for treating disease, in diagnosis and for identifying
ouggood and Aspergillus, comprises hybridizing the amplified nuclacid of the fungal pathogen with a probe from the internal transcribed spacer region of a DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PNA; peptide nucleic acid; nuclease resistance; diagnostic; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of identifying a modulator of Cdc25 activity that comprises contacting a test cell having a recombinant Cdc25 phosphatase gene whose expression alters transcription of a selected gene, with a compound under conditions where recombinant Cdc25 phosphatase gene is expressed and alters the transcription of a selected gene as an indication of the compound being a modulator of Cdc25-mediated transcription. The method is useful for identifying modulators of Cdc25
                                                                                                                                                                                                                                        Assay for screening modulators of Cdc25 activity by using a cell having recombinant Cdc25 phosphatase gene whose expression alters the transcription of a selected gene in the presence of a modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     activity. Sequences AAF57363-376 represent intron/exon splice junction sequences of the murine Cdc25A gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Van Der Weide M;

                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant some. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine
                    for
                  contacting a test solution with the macromolecule and RNaseH), or (3) for in-vivo enhancement of polynucleotide hybridisation and RNase activity. They can also be used diagnostically and for screening chemotherapeutic

The present invention relates to oligonucleotides that downregulate the expression of human Grb2-related with Insert Domain (GRID) gene. GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was
                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                      The present invention relates to oligonucleotides that downregulate the expression of human Grb2-related with Insert Domain (GRLD) gene. GRLD is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRLD, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous solerosis; port wine stain; wound healing; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; ss; osler-Weber-rendu syndrome, leukaemia; osteoporosis; DNAzyme; inozyme;

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour anglogenesis, diabetic retinopathy, macular degeneration, tumour anglogenesis, diabetic retinopathy, macular degeneration, cumour anglofibroma of tuberous sclerosis, port-wine stains, Sturge wolfares, anglofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu (Syndrome, leukaemia, osceoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as MG2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ARX.7354-ABXZ2719 represent mucleic acide, including antisense and enzymatic mucleic acide molecules which regulate expression of ERG, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ1; MDZ12; chromosome 7g22.1; chromosome 6p21.3-22.2; chromosome 6p21.3-22.3; chromosome 16p11.2; chromosome 15g26.1; cancer; developmental disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                  Novel polynucleotide which down regulates expression of Ets-related gen useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                      proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 be cancoded at chromosome 792.1, MD24 is encoded at chromosome 692.1, MD24 is encoded at chromosome 692.13.22.2, MD24.1 is encoded at chromosome 692.13.22.2, MD24 is encoded at chromosome 692.13.22.2, MD24.1 is encoded at chromosome 1591.3 encoded at chromosome 1592.6.1. The MD23, MD24, MD27, and MD21 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymetic nucleic acid; hammerthead ribozyme; DNAzyme; inozyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state, HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                      New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3,

```
the synthesis, expression and/or grability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, incorpuse, zinzymes, amberzymes, and G-cleaver ribozymes, DNAzymes, controlled acids such an aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and control are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represente a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis, antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptemer; HBV reverse transcriptase; Enhancer I region; viral replication;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to nucleic acid molecules which modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                           RIBO-)
```

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, or inozymes, zinzymes, amberzymes, anderzymes, anderziptase and or-leaver ribozymes. Also disclosed are nucleic acids may be used to modulate the expression of HBV CC and of Compounds and HBV viral replication, Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocallular expression such as cirrhosis, liver failure, and hepatocallular expression and number sequence represents a substrate for one of the HCV invention in the present
```

The present invention relates to murine oligonucleotides (ACC62754-ACC68006), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
IKappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), inflammatory disease (e.g. rheumatoid arthritis,
cestenosis or asthma), inflammatory disease, diabetes, obesity, autoimmune
ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
cexpression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human NOGO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection;

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin DZ receptor (FTGDR),
IKappa Kinase (IKK), or protein Kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
cischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
cxpression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased calls or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenoisis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gape

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
[KappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: creebrovascular accident, central
nervous system (CKS) injury, spinal cord injury, cancer (e.g. melanoma,
[KappaB kinase (IKK)], inflammatory disease (e.g. rheumatoid arthritis,
restencis or asthma), Crohn's disease, dispetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis).
Conditions (e.g. asthma, allergic Rhinitis) are aliagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human IKK-
gamma substrate sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin DZ receptor (PTGDR),
KappaB kinase (IKK), or protein Kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
convention are useful for treating: cerebrovascular accident, central
convention are useful for treating: cerebrovascular accident, central
convention are useful for treating: creebrovascular accident, central
convention are useful for treating: creebrovascular accident, central
convention are useful for treating: creebrovascular accident, central
convention actions), inflammatory disease, diabetes, obesity, autoimmune
central reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
cutofic acides of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
charges RNA in a cell. The present RNA sequence represents a human IKK-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                     Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

                                                                                                                                                                                                                                                                         The invention relates to a nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, e.g. a hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyme, DNAzyme, amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell call by contacting the cell with the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the norel muth the novel nucleic acid molecule, treating a patient having a condition associated with the level of GRID cene by contacting the cell with the novel nucleic acid molecule, cleaving RNA of a GRID gene by contacting the cell with the novel nucleic acid molecule, newpression vector comprising a nucleic acid sequences (encoding at least the novel nucleic acid molecule in a manner that allows its expression), a mammalian cell including the expression vector and an enzymatic nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule is useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is a target region for the enzymatic nucleic acide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                          New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and

The invention relates to a nucleic acid molecule that down-regulates
expression of Grb2-related with insert domain (GRID) gene, e.g. a
capression of Grb2-related with insert domain (GRID) gene, e.g. a
hammerhead ribozyme, NGH ribozyme, G-cleaver ribozyme, Zinzyme, Dinzyme, Dinzyme, Dinzyme, Dinzyme, Dinzyme, Dinclude are a mammalian cell
captuding the novel nucleic acid molecule, reducing GRID activity in a
cell by contacting the cell with the novel nucleic acid molecule,
creating a patient having a condition associated with the level of GRID
(e.g. tissue/graft rejection or leuksemia) by contacting the cell with
contacting the cell with the novel nucleic acid molecule, an expression
contacting the cell with the novel nucleic acid molecule, an expression
contacting the cell with the novel nucleic acid molecule, an expression
contacting the cell with the novel nucleic acid molecule, an expression
contacting the cell with the novel nucleic acid molecule in a manner that allows its expression, a
mammalian cell including the expression vector and an enzymatic nucleic
cacid molecule that cleaves RNA derived from a GRID gene. The nucleic acid
cacid molecule for treating a condition associated with the level of
GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is
cacid molecule for the enzymatic nucleic acide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    enzymatic nucleic acid, RNA cleavage; hepatitis C virus; HCV; infection; type I interferon; DNAzyme.

                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                        Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                 The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Maize, corn, Zea mays, delta-9 desaturase, GBSS, target, substrate, granule bound starch synthase; hammerhead ribozyme; hairpin ribozyme; modulation; gene expression; transgenic plant; cleavage; canola plant; caffeine synthesis; coffee plant; nicotine production; tobacco; fruit ripening; flower pigmentation; lignin production; ss.

The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine
                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This exon specific primer used in the PCR amplification of a short stature associated sequence. The gene region corresponding to short stature has been identified as a region of approximately 500 kb in the PARI region of the X and Y chromosomes. The egenes in this region have been identified as candidates for the short stature gene. These genes were designated SHOX (also referred to as SHOX93 or HOX93), pET92 and SHOX (slox-like homeobox gene on chromosome three). The SHOX gene has two separate splicing sites resulting in two variations SHOXa and SHOXb. The specification provides sequences of SHOX (short stature homeobox-containing) genes SHOX ET92, SHOXb, SHOT and exons of the SHOX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homeobox domain; human growth gene; growth regulation; growth defect; turner's syndrome; short stature homeobox containing gene; short stature; SHOX; bone disease; osteoporosis; calcium regulation; PCR primer; ss.

ö
genes as shown in AAV35610 to AAV35621 and protein sequences of the human growth protein transcription factor SHOXA, SHOXD and SHOT as shown AAW60573. The novel genes are responsible for human growth. Defects in the genes and cause short stature, e.g. Turner's syndrome. The products can be used to develop agents for the treatment of short stature or other human growth disorders. The products can also be used for providing a mitogenic effect on cells, e.g. for the treatment of bone diseases such as osteoporosis and diseases involved with disturbance in the bone calcium regulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel probe for hybridising to a target nucleic acid and detecting gene polymorphisms. The probe comprises a base sequence that is complementary to the target nucleic acid and has at least one artificial mismatch and at least one original mismatch with respect to the target nucleic acid, where the artificial mismatch with original mismatch and effect in different base positions. The probe of the invention may be useful for detecting genetic variation by gene amplification, mutation-specific DNA sequencing or a mutation-specific DNA chip, preferably for detecting a polymorphism in exon 2 of HIA-DRB1. The current sequence is that of a probe of the invention which was used to detect a polymorphism in human HIA-DRB1 exon 2 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   probe for detecting gene polymorphism, contains oligonucleotide is complementary to target sequence, has artificial mismatch with ct to target, and has original mismatch with respect to allelic

This invention relates to a novel chemical sensor system method.

Specifically, it refers to an isolated nucleic acid molecule that encodes a receptor protein, which binds to chemicals that can stimulate the sense of taste or small for example. The present invention describes the manufacture of a chip that acts as a support to immobilise transfected calls expressing the receptor gene, such that this chip can be employed as a component of the chemical sensor model. Furthermore, this chip is useable as an artificial sensory organ where the chemical receptor contains an olfactory receptor the sensor can react to olfactory stimulation. Accordingly, these sensors are useful in the food industry contains environmental examination and disease diagnosis. Furthermore, such systems are automatable for high throughput applications under carrious conditions, even for differentiating optical isomers of R(-)-carvone easily. This oligonucleotide sequence is used to construct an odourant receptor DNA expression vector of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chemical sensor systems based on chemical receptors introduced into cells for immobilization onto support to form chip as component of sensor, useful in detecting stimuli e.g. taste and smell applicable in food
                                                                                                                                                                                                                                   DNA oligo to construct an odourant receptor expression vector SegID102.

The present invention relates to oligonucleotides that downregulate the expression of human Grb2-related with Insert Domain (GRID) gene. GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was
                                                                                         Human, Grb2-related with Insert Domain; GRID; T-cell; co-stimulatory adaptor protein; tissue rejection; graft rejection; leukaemia; cytostatic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, Grb2-related with Insert Domain; GRID; T-cell; co-stimulatory adaptor protein; tissue rejection; graft rejection; leukaemia; cytostatic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid(s) for regulating the Grb2-related with Insert D (GRID) gene comprises using antisense and enzymatic nucleic acid molecules such as hammerhead ribozymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, cumour angiogenesis, diabetic retinopathy, macular degeneration, necessitar angiogeneration, arthritis, psoriasis, vertuca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge where yindrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu syndrome, Aippel-Trenaunay-Weber syndrome, Osler-Weber-rendu syndrome, apatient having a condition associated with the level of ERG, treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour conditions suitable for the treatment. Leukaemia or tumour conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ENG activity in a coll, by contacting (I) the useful for dispance of advance call, by contacting (I) the useful for dispance of advance call of the expression of ERG, and as diagnostic tool to cation such as Mg2+. (I) is useful for specifically cateding genes that share homology with ERG gene or ERG fusion genes. Consumers of the stage of conditions and call of the specifically cargeting genes that share homology with ERG gene or ERG fusion genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; ds; single nucleotide polymorphism; SNP; cytochrome; P4502A6;
CYS4502A6; CYP2A6, chromosome 19; eteroid metabolism;
drug detoxification; xenobiotic detoxification; procarcinogen activation;
inflammation; asthma; habitual smoking.
 useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                enzymatic nucleic acid molecules which regulate expression of ERG, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                               The present invention relates to oligonucleotides that downregulate the expression of human Gry2-related with Insert Domain (GRID) gene. GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel polynucleotide which down regulates expression of Ets-related gene,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             neovascular glaucoma, myopic degeneration, arthritis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stain, wound healing; Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, leukaemia, 88;
                                                                                                                                                                New nucleic acid(s) for regulating the Grb2-related with Insert Domain (GRID) gene comprises using antisense and enzymatic nucleic acid molecules such as hammerhead ribozymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ophthalmological, antiarthritic, antipsoriatic, virucide, osteopathic, vulnerary, cancer, lymphoma; Ewing's sarcoma; melanoma, psoriasis, tumour angiogenesis, diabetic retinopathy, macular degeneration;

                                                                                                                                The invention comprises the identification of genetic polymorphisms in the human cytochrome P4502A6 (CYP4502A6 or CYP2A6) gene. The human cytochrome P4502A6 (CYP4502A6 or CYP2A6) gene. The human cytochrome P4502A6 gene is located on chromosome 19 and encodes an enzyme that plays a role in the metabolism of steroids, the detoxification of drugs and xenobiotics, and the activation of procarcinogens. The P4502A6 polymorphisms identified in the invention are useful for evaluating an individual's risk of developing asthma or an individual's propensity for cigarette consumption. The P4502A6 DNA sequences of the invention are useful for identifying individuals having a polymorphic genotype and to screen individuals for altered metabolism for cytochrome P4502A6 substrates. The P4502A6 DNA sequences of the invention are also useful for identifying individuals who are at risk from inflammation, asthma, habitual smoking and diseases that result from environmental or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; ds; single nucleotide polymorphism; SNP; cytochrome; P4502A6; CYP4502A6; CYP2A6; chromosome 19; steroid metabolism; drug detoxification; xenobiotic detoxification; procarcinogen activation;
                                                                                                                                                                                                                                                                                            occupational exposures to dangerous substances. The present DNA sequence represents a polymorphic region of the promoter for the human cytochrome P4502A6 gene

The human cytochrome P4502A6 (CYP4502A6 or CYP2A6) gene. The human cytochrome P4502A6 gene is located on chromosome 19 and encodes an enzyme that plays a role in the metabolism of steroids, the detoxification of drugs and xenobiotics, and the activation of procarcinogens. The P4502A6 polymorphisms identified in the invention are useful for evaluating an individual's risk of developing asthma or an individual's propensity for cigarette consumption. The P4502A6 DNA sequences of the invention are substrates. The P4502A6 DNA sequences of the invention are substrates. The P4502A6 DNA sequences of the invention are also useful for identifying individuals who are at risk from inflammation, asthma, habitual smoking and diseases that result from environmental or occupational exposures to dangerous substances. The present DNA sequence occupational exposures to dangerous substances. The present DNA sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRS), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophagel, stoomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouzacil carboplatin, methotrexate, gemiclabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma. Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, asthma. Control inflammatory bowel disease or infection. The sequence represents the substrate of a novel enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                      Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule are useful, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ6520 - ABZ65224, ABZ65530 - ABZ65216, Human
                                                                                                                                                                                                                                                                                                                                                                  Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gape

                                                                  The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-theumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ56859 - ABZ665216, ABZ66531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66554 or the human ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid, harmerihead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative, disease state, HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or the synthesis, expression and/or stability of Hepatitis C virus (HCV) or and enzymatic nucleic acids such as hammerhead ribozymes. DNAzymes, and enzymes, zinzymes, amberzymes, and G-cleaver ribozymes. DNAzymes, or are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well constructed and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds confidence acids the average of the compounds and disease states related to HBV and HCV infection, replication and gene compounds and disease states related to HBV and HCV infection, replication and gene compounds and sequence represents a substrate for one of the HCV DNAZYME or minus strand DNAZYME sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                    Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                 The present invention relates to nucleic acid molecules which modulate
the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
inozymes, zhrzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
are nucleic acid decoy molecules and aptamers that bind to HBV reverse
transcriptase and/or HBV reverse transcriptase primer sequences, as well
as oligonucleotides that specifically bind the Enhancer I region of HBV
DNA. The nucleic acids may be used to modulate the expression of HBV
compounds and/or potential therapies directed against HBV, and compounds
that modulate the expression and/or replication of HCV. The compounds and
methods of the invention are useful for the treatment of degenerative and
carcinoma. The present sequence represents a substrate for one of the HCV
conversion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              tumour suppression; tumour reversion; apoptosis; virus resistance; cytostatic; virucide; neuroprotective; nootropic; neuroleptic; probe; primer; PCR; gene chip; antisense; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ds; human.

This invention relates to novel isolated nucleic acid sequences involved in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the anotropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or probes and primers for detecting, indentifying, quantifying and/or complitying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of polypeptides. The invention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention.

Once: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                            New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, 89, GRID, Grb2-related with insert domain, hammerhead ribozyme,

The invention relates to a nucleic acid molecule that down-regulates carpession of Grb2-related with insert domain (GRID) gene, e.g. a hammerhead ribozyme, NCH ribozyme, Alizyme, Zhizyme, DNAzyme, amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell calluding the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the cell with the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the cell with the level of GRID (e.g. tissue/graft rejection or leukaemia) by contacting the cell with the novel nucleic acid molecule, cleaving RNA of a GRID gene by contacting the cell with the novel nucleic acid molecule, an expression vector comprising a nucleic acid sequences (encoding at least the novel nucleic acid molecule in a manner that allows its expression, a mammalian cell including the expression vector and an enzymetic nucleic acid molecule is useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is a target region for the enzymatic nucleic acide that region for the enzymatic nucleic acide target region for the enzymatic nucleic acide acides of the invention.
                                                New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      enzymatic nucleic acid; RNA cleavage; hepatitis C virus; HCV; infection; type I interferon; DNAzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              3.0%; Score 13.4; DB 1; Length 17; 93.3%; Pred. Pavco PA,

```
from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence is a novel peptide nucleic acid (PNA), which acts as an inhibitor of mammalian, preferably human, telomerase. The PNAs hybridise specifically to an RNA component of mammalian telomerase, and include the sequence GGG for specific hybridisation to the template region of this component. PNAs can be used as probes to detect the RNA component of
                                                                        The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         / cdbase= OTHER

The PNAs hybridise specifically to an RNA component of mammalian telomerase, and include the sequence GGG for specific hybridisation to the template region of this component. PNAs can be used as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, especially
mammalian telomerase and as inhibitors of telomerase activity, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New peptide nucleic acids hybridising to mammalian telomerase RNA - used to inhibit telomerase, for treating tumours and other proliferative diseases, also for diagnosis.

The PNAs hybridise specifically to an RNA component of mammalian telomerase, and include the sequence GGG for specific hybridisation to the template region of this component. PNAs can be used as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, especially in the treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide nucleic acids hybridising to mammalian telomerase RNA - used to inhibit telomerase, for treating tumours and other proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "Sugar-phosphate backbone has been replaced by a peptide backbone"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Revised record issued on 21-OCT-2004 : Correction to feature table key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gape

The present sequence represents a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an ill nucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 concers, which include the sequence of TTAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The cancers, neoplasia, hyperplasia, neurodegenerative diseases. The deformance of degradation by proteases or nucleases. The cancers, neoplasia, hyperplasia, neurodegenerative diseases. The deformance of degradation with summodeficiency virus (HVV) infection/ANDS (acquired immunodeficiency virus (HVV) infection/ANDS (acquired immunodeficiency virus (HVV) infection/ANDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other cyclocation of the activity, in combination with antineoplastic and other cyclocation of cyclotatic agents, antifungal agents, and other nucleotides. PNAs may be sectivity, in combination with antineoplastic and other cyclocation probes to detect or quantitate polynucleotides having a human telomerase and so triament length polymorphism (RFLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention can be used to detected as cancerous conditions to be detected with increased confidence and pathological characteristics. The diagnostic and prognostic and proplastic cell or expresses telomerase activity and its RNA component immortal or mechads of the present invention can be used to detect an immortal or mechads of the present activity and its RNA 
                                                                                                                                                                                                                                                                                                 New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide nucleic acid; PNA; telomerase; ribonucleoprotein enzyme; cancer; inhibitor; neoplasia; neurodegenerative disease; aging; hyperplasia; AIDS; HIV; fungal infection; forensic identification; detect; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           is an antitumour composition comprising the antitumour augmenting agent and an antitumour agent as effective components. The present sequence represents a hybridisable oligonucleotide for human RERF-LC-A1, used in the exemplification of the present invention. When the antitumour composition is administrated into a mammal, especially human, a sufficient antitumour effect is exhibited to cancer cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /*tag= a //rag= nucleic acid molecule, where N-(2-note= "Peptide nucleic acid molecule nucleotide bases

The present sequence represents a peptide nuclear acts molecule which the present sequence represents a peptide nuclear acts molecule which telomerase activity. Telomerase is a ribonucleoprotein enzyme that telomerase activity. Telomerase is a ribonucleoprotein enzyme that telomerase activity. Telomerase is a ribonucleoprotein enzyme that concledide sequence contained within the RNA component of the enzyme. The nucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The therapeutic PNAs may be used for treating diseases or nucleases. The therapeutic PNAs may be used for treating diseases conditions such as cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other cycloxic or cycostated by abnormal telomera metabolism or telomerase activity, in combination with antineoplastic and other cycloxic or cycostated by abnormal telomera metabolism or telomerase activity and other nucleotides having a human telomerase conditions to defect the RNA component of a mammalian telomerase and as probes to detect the RNA component of a mammalian telomerase and as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention allows cancerous conditions to be detected with increased confidence and or nathological characteries activity. The method of the present invention has an underlast and as an explanation of the present invention of hased on nathological characteries activity. The method of the present invention of hases

The present sequence represents a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits ctelomerase activity. Telomerase is a ribonucleoprotein enzyme that extended the telomeric DNA, using as a template an 11 structucities sequence contained within the RNA component of the enzyme. The sucleotide sequence contained within the RNA component of the enzyme. The nucleotide sequence contained within the RNA component of the enzyme. The concerns which include the sequence GTTAGG The uncharged nature of the PNA cackbone increases the melting temperature of associating strands, increases the rate of association with targeted nuclein acids, and affords greater resistance of degradation by proteases or nucleases. The charapeutic PNAs may be used for treating disease conditions such as cancers, neoplasia, hyperplasia, neurodegenerative diseases. The characterized by abnormal telomere metabolism or telomerase communication with antineoplastic and other cytcoxic or sectivity, in combination with antineoplastic and other cytcoxic or cytcostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization of individuals, e.g. paternity testing, based on hTR gene restriction of individuals, e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RFLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention allows cancerous conditions to be detected with increased confidence and

Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an ill nucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PNA backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The therapeutic PNAs may be used for treating disease conditions such as cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a mammalian telomerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide nucleic acid; PNA; telomerase; ribonucleoprotein enzyme; cancer; inhibitor; neoplasia; neurodegenerative disease; aging; hyperplasia; AIDS; HIV; fungal infection; forensic identification; detect; tumour; paternity testing; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /ncte= "Peptide nucleic acid molecule, where N-(2-aminoethyl)glycine units are linked to nucleotide bases via glycine amino N through a methylenecarbonyl linker"
possibly at an earlier stage, before cells are detected as cancerous based on pathological characteristics. The diagnostic and prognostic methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the cell expresses telomerase activity and its RNA component.
                                                                                                                                                                                   Gaps
                                                                                                                                                                                 .

control sequence alongside a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits celomerase activity. Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an 11 invention relates to PNA molecules having a sequence of no more than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PNA cackbone increases the melting temperature of associating strands, and affords greater resistance of degradation by proteases or nucleases. The therapeutic PNAs may be used for treating disease conditions such as cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human immunodeficiency virus (HIV) infection/AIDS (acquired immunodeficiency cyrolated pathologies, fungal infections, and other cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization of individuals, e.g. paternity testing, based on hTR gene restriction of individuals, e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RRLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as allows cancerned cancerned and cancerned cancerne
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide nucleic acid; PNA; telomerase; ribonucleoprotein enzyme; cancer; inhibitor; neoplasia; neurodegenerative disease; aging; hyperplasia; AIDS; HIV; fungal infection; forensic identification; detect; tumour; paternicy testing; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /*tag= a
/*tag= = "Peptide nucleic acid molecule, where N-(2-
mainoethyl) glycine units are linked to nuclectide bases
via glycine amino N through a methylenecarbonyl linker"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       possibly at an earlier stage, before cells are detected as cancerous based on pathological characteristics. The diagnostic and prognostic methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the cell expresses telomerase activity and its RNA component
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

The present sequence represents a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits call hybridises to the mRNA component of mammalian telomerase, and inhibits call the care the telomerase, and inhibits are telomerases activity. Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an 11 nucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no moore than 25 bases, which include the sequence GTTAGG. The uncharged nature of the PNA careckbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The charapeutic PNAs may be used for treating disease conditions such as cancers, neoplasia, hyperplasia, neurodegenerative diseases or nucleases. The charapeutic PNAs may be used for infection/AIDS (acquired immunodeficiency virus (HIV) antineoplastic and other cytcoxic or cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization of individuals, e.g. paternity testing, based on HTR gene restriction of individuals, e.g. paternity testing, based on HTR gene restriction of individuals, and component of a mammalian telomerase and as through the component of a mammalian telomerase and and probes to detect the RNA component of a mammalian telomerase and and noted and an allows cancerous conditions to be detected with increased conditions and an analysis of the present invention and allows cancerous conditions to be detected with increases and as an angent and an analysis and an areal and as an angent and a

```
The present sequence represents a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomerase, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that synthesizes one strand of the telomeric DNA, using as a template an 11 nucleotide sequence contained within the RNA component of the enzyme. The incloude the pNA manying a sequence of no more than 25 backbone increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The increases the melting temperature of associating strands, increases the rate of association with targeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The increases the rate of association with the argeted nucleic acids, and affords greater resistance of degradation by proteases or nucleases. The increases that are target of a canceria, mental acid manucleficiency virus (HTV) infection/ALDS (acquired immunodeficiency syndrome) and associated pathologies, fungal infections, and other diseases, aging, human cativity, in combination with antinooplastic and other cytocoxic or cytostatic agents, antifungal agents, and other nucleotides. PNAs may be cytostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization probes to detect to quantitate polynucleotides having a human telomerase and individuals, e.g. paternity testing, based on hrm gene restriction frament length polymorphism (RPLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention can be used to detected as cancerous conditions to be detected with increased confidence and nephastic cell or truncur tissue or cancer of any origin, provided the conditions are also used to detect an immortal or neoplastic cell expresses 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                v peptide nucleic acid (PNA) compounds that inhibit telomerase activity mammalian cells is useful as probes to detect the RNA component of a

The present sequence represents a peptide nucleic acid molecule which hybridises to the mRNA component of mammalian telomeraes, and inhibits telomerase activity. Telomerase is a ribonucleoprotein enzyme that telomerase scrivity. Telomerase is a ribonucleoprotein enzyme that telomerase activity. Telomerase is a ribonucleoprotein enzyme that telomerase so the telomeric DNA, using as a template an 11 nucleotide sequence contained within the RNA component of the enzyme. The invention relates to PNA molecules having a sequence of no more than 25 backbone increases the melting temperature of associating strands, increases the rate of association with targered nucleic acids, and a flords greater resistance of degradation by proteases or nucleases. The therapeutic PNAs may be used for treating disease conditions such as therapeutic PNAs may be used for treating disease conditions such as cancers, neoplasia, hyperplasia, neurodegenerative diseases, aging, human diseases characterized pathologies, fungal infections, and other diseases characterized by abnormal telomere metabolism or telomerase activity, in combination with antineoplastic and other cytotoxic or cycostatic agents, antifungal agents, and other nucleotides. PNAs may be used for molecular diagnostics, labelled PNAs are used as hybridization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New peptide nucleic acid (PNA) compounds that inhibit telomerase activity in mammalian cells is useful as probes to detect the RNA component of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           probes to detect or quantitate, polymucleotides having a human telemerase RNA (hTR) sequence. PNA probes are also used for forensic identification of individuals, e.g. paternity testing, based on hTR gene restriction fragment length polymorphism (RFLP) pattern. PNAs are also useful as probes to detect the RNA component of a mammalian telomerase and as inhibitors of telomerase activity. The method of the present invention allows cancerous conditions to be detected with increased confidence and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                possibly at an earlier stage, before cells are detected as cancerous based on pathological characteristics. The diagnostic and prognostic methods of the present invention can be used to detect an immortal or neoplastic cell or tumour tissue or cancer of any origin, provided the

The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase RNA component (hTR) sequence, as well as in forensic identification of individuals, such as perernity testing or identification of criminal suspects or unknown descendants based on the hTR gene RFLP pattern. The suspects or unknown descendants based on the hTR gene RFLP pattern. The pythoproliferative diseases, and unknown descendants or preventing cancer, inflammation, lymphoproliferative diseases, and commune disease, or neurodegenerative diseases, are prostatic agents) can be used for treating neoplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to peptide nucleic acids (PNAs), comprising a sequence of 6-25 nucleobases, that inhibit telomerase activity in mammalian cells by hybridising to the RNA component of mammalian telomerase. The PNAs are useful as probes to detect the RNA component of mammalian telomerase and as inhibitors of telomerase activity, or to detect and/or quantitate polynucleotide having the human telomerase RNA component (HTR) sequence, as well as in forensic identification of individuals, such as paternity testing or identification of criminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1. .13

Dynamic of the page of treating or preventing cancer, information, lymphoproliferative diseases, autoimmune disease, or neurodegenerative diseases, an combination with other pharmaceuticals (such as diseases. The PMAs in combination with other pharmaceuticals (such as antineoplastic or cytostatic agents) can be used for treating neoplasia, hyperplasia, human immunodeficiency virus (HIV) infections, acquired immunodeficiency syndrome (AIDS) and associated pathologies, and other diseases characterised by abnormal telomere metabolism or telomerase activity. The present sequence represents one of the PNA sequences of the invention. Note: The present sequence represents SED ID No 4 in the SEQ ID Internal and column 4. However, table 1 in column 29 shows three sequences with SEQ ID No 4. The first SEQ ID No 4 (PNA #6, AASI5433) appears to be identical to SEQ ID No 1 in the claims and the SEQ ID isting. The second SEQ ID No 4 in table 1 appears to be identical to SEQ ID 4 is the present sequence and appears to be identical to SEQ ID 4 in the SEQ ID No 4 in the present sequence and appears to be identical to SEQ ID 4 is the present sequence and appears to be identical to SEQ ID No 4 in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /*tag= a
